

ABSTRACT OF THE DISCLOSURE

In a delivery box system for delivering an article, a navigation device of an moving body receives navigation execution ID information and position information of a particular delivery box which are related to each other by a central computer of a central management center, automatically executes navigation based on the navigation execution ID information as well as guides the moving body from the present position thereof to a moving destination where the particular delivery box is installed. With the above arrangement, a route to a movement destination at which the article is delivered can be guided by a moving guide, an article-receiving person can easily reserve and use the delivery box, the security of the delivery box system can be improved by giving a reservation ID number inherent to each reserving action, a payment condition to the article can set as a part of article delivery conditions. Accordingly, there can be provided a delivery box system, by which delivery of an article can be completed on the condition that the acceptance of an article-receiving person is previously obtained as to the place where the article is delivered and who bears the usage fee of the delivery box, as well as a box reserving method and a charging method making use of the delivery box system.
